

# USER MANUAL

## 1. Configuration Settings

The **Configuration Settings** page allows you to define and manage the programming languages and their execution environments used for evaluating student assignments.

**Creating a New Configuration:** To add a new language environment, fill in the required fields on the right panel:

- **Programming language:** Enter the name of the language or environment (e.g., Java 17, Python 3).
- **File Extension:** Specify the standard file format for the source code (e.g., .java, .py).
- **Compiler / Interpreter Path:** Provide the absolute path to the executable tool on your system (e.g., C:\Program Files\Java\jdk-17\bin\javac.exe).
- **Compile Command:** Define the command line structure needed to compile the code. You can use placeholders like `{src}` for the source file and `{out}` for the output file. You can leave this field empty for interpreted languages like Python.
- **Run Command:** Define the command to execute the compiled program or script.
- **Comparison Strategy:** Select the evaluation method from the dropdown menu to determine how the student's output will be compared against the expected output.
- **Save Configuration:** Click this button at the bottom right to securely add your new setup to the system.

### Managing Saved Configurations:

- **Update:** Select any existing language from the **Saved Configurations** list on the left. Make your necessary modifications in the input fields and click the **Update** button to save changes.

- **Delete:** Select a configuration from the list and click the **Delete** button to permanently remove it from your workspace.

Expected Output:

**Open Existing Project**

Select a project to load: ?

Project:

**OK** **Cancel**

Project 'Project1' loaded successfully!

**Run Evaluation** **Open Existing** **Create Project**

## 2. Project Management (Create New Assessment)

The **Project Management** page is the core workspace where instructors set up, manage, and execute the automated evaluation tasks.

### Configuring a Project:

**Project Name:** Enter an identifier for the assignment (e.g., "Project1").

**Submissions Directory (ZIPs):** Use the **Browse...** button to select the local directory containing the students' submitted ZIP files.

**Select Configuration:** Choose the appropriate language environment (e.g., "Java 17") from the dropdown menu, which links to your saved settings.

**Program Arguments:** Provide any command-line arguments required for the execution. If none are needed, leave it blank.

**Expected Output:** Paste the exact correct output (e.g., "Hello World") that a flawless student program should produce. This is the baseline for the comparison strategy.

- **Project Actions & Execution:**

**Create Project (Save):** Clicking this button securely saves your current field entries into the system's database as a reusable project without executing it.

**Open Existing (Load):** As shown in the overlay dialog box, clicking this allows you to select a previously saved project (e.g., "Project1"). Clicking **OK** will automatically auto-fill all the input fields with that project's details, saving significant time.

**Run Evaluation:** Click the green button to initiate the evaluation. The engine processes the ZIP files securely in the background. Once finished, a status message (e.g.,

"Evaluation completed! 2 submissions processed.") will appear to notify you that the results are ready to be viewed.

The screenshot shows the Integrated Assignment Environment (IAE) interface. On the left, there is a sidebar with three buttons: "Create New Assessment", "Configuration Settings", and "Project Results". The main area displays a table with the following columns: "Student ID", "Status", "Match %", and "Actions". The table contains two rows of data:

| Student ID | Status | Match % | Actions                 |
|------------|--------|---------|-------------------------|
| 12345678   | PASS   | 100.0%  | <a href="#">Details</a> |
| 313123123  | FAIL   | 0.0%    | <a href="#">Details</a> |

Below the table, there is a text area that says "Select a student to view error details...". In the bottom right corner, there is a small notification: "Windows'u Etkinleştir Windows'u etkinleştirmek için Ayarlar'a gidin."

### 3. Project Results (Evaluation Overview)

The **Project Results** page provides a comprehensive overview of the automated evaluation outcomes for all processed student submissions.

#### Understanding the Results Table:

- **Student ID:** Displays the unique identifier for each student, automatically extracted from their submitted files or folders.
- **Status:** Indicates the final evaluation state of the submission (e.g., **PASS** for a completely successful execution and output match, **FAIL** for incorrect output, or other errors like Compilation/Runtime issues).
- **Match %:** Shows the percentage of similarity between the student's actual output and your expected output, calculated based on the selected comparison strategy.
- **Actions (Details):** Click the blue **Details** button next to any student to dive deeper into their specific submission.

#### Error Details Panel:

- At the bottom of the screen, there is a dedicated text area displaying "*Select a student to view error details...*". When you select a failed submission, this panel will display specific error logs, compilation warnings, or highlight the exact differences between the expected and actual outputs to help you understand why the student lost points.

File

Help

Save (Export) Configs

Load (Import) Configs

---

#### 4. Top Menu Bar (File & Help)

The top menu bar provides global actions for the application, specifically focusing on data portability and user assistance.

##### File Menu:

- **Save (Export) Configs:** Clicking this option compiles all your saved language configurations (from the Configuration Settings page) and exports them as a single `.json` file to your computer. This is highly useful for backing up your environment or sharing your exact setup with other instructors.
- **Load (Import) Configs:** This allows you to browse your computer for a previously exported `.json` configurations file. Once selected, the system will instantly import and populate all the language environments, saving you from setting them up manually.

##### Help Menu:

- **Help:** Clicking this opens the comprehensive User Manual (this document) in your system's default viewer, providing immediate guidance on how to use the Integrated Assignment Environment.
