

USER MANUAL

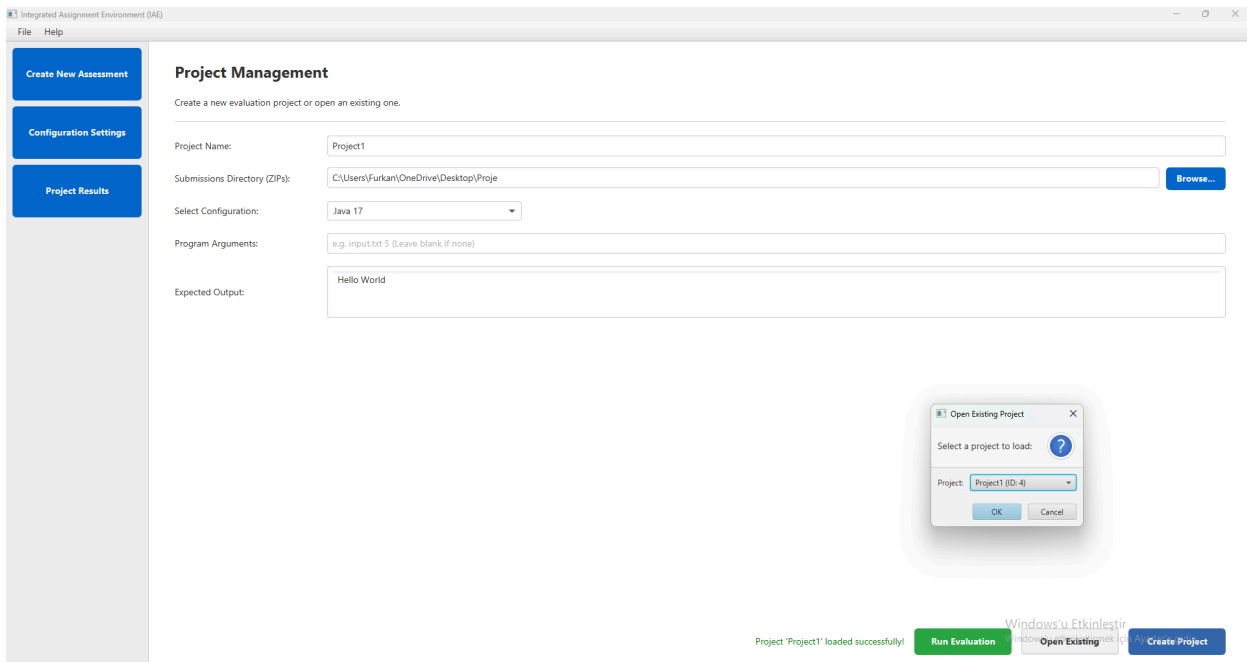

The Configuration Settings page allows you to define and manage the programming languages and their execution environments used for evaluating student assignments.

Creating a New Configuration: To add a new language environment, fill in the required fields on the right panel:

- **Programming language:** Enter the name of the language or environment (e.g., Java 17, Python 3).
- **File Extension:** Specify the standard file format for the source code (e.g., .java, .py).
- **Compiler / Interpreter Path:** Provide the absolute path to the executable tool on your system (e.g., C:\Program Files\Java\jdk-17\bin\javac.exe).
- **Compile Command:** Define the command line structure to compile the code (leave empty for interpreted languages). **You must use placeholders: {src}** for a single source file, **{out}** for the executable, or **{dir}** for the extracted student folder.
 - *Example (C - Single file):* **gcc {src} -o {out}**
 - *Example (Java - Multi-file):* **javac -d {dir} {dir}/*.java**
- **Run Command:** Define the command to execute the compiled program or script.
 - *Example (C):* **{out}**
 - *Example (Java):* **java -cp {dir} Main** (Note: Specify the exact main class name).
- **Comparison Strategy:** Select the evaluation method from the dropdown menu to determine how the student's output will be compared against the expected output.
- **Save Configuration:** Click this button at the bottom right to securely add your new setup to the system.

Managing Saved Configurations:

- **Update:** Select any existing language from the Saved Configurations list on the left. Make your necessary modifications in the input fields and click the Update button to save changes.
- **Delete:** Select a configuration from the list and click the Delete button to permanently remove it from your workspace.

2. Project Management (Create New Assessment)

The **Project Management** page is the core workspace where instructors set up, manage, and execute the automated evaluation tasks.

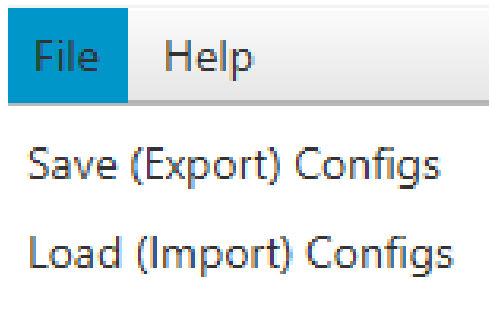

Configuring a Project:

- **Project Name:** Enter an identifier for the assignment (e.g., "Project1").
- **Submissions Directory (ZIPs):** Use the **Browse...** button to select the local directory containing the students' submitted ZIP files.
- **Select Configuration:** Choose the appropriate language environment (e.g., "Java 17") from the dropdown menu, which links to your saved settings.
- **Program Arguments:** Provide any command-line arguments required for the execution. If none are needed, leave it blank.
- **Expected Output:** Paste the exact correct output (e.g., "Hello World") that a flawless student program should produce. This is the baseline for the comparison strategy.
- **Project Actions & Execution:**
- **Create Project (Save):** Clicking this button securely saves your current field entries into the system's database as a reusable project without executing it.

- **Actions (Details):** Click the blue **Details** button next to any student to dive deeper into their specific submission.

Error Details Panel:

- At the bottom of the screen, there is a dedicated text area displaying "*Select a student to view error details...*". When you select a failed submission, this panel will display specific error logs, compilation warnings, or highlight the exact differences between the expected and actual outputs to help you understand why the student lost points.

4. Top Menu Bar (File & Help)

The top menu bar provides global actions for the application, specifically focusing on data portability and user assistance.

File Menu:

- **Save (Export) Configs:** Clicking this option compiles all your saved language configurations (from the Configuration Settings page) and exports them as a single `.json` file to your computer. This is highly useful for backing up your environment or sharing your exact setup with other instructors.
- **Load (Import) Configs:** This allows you to browse your computer for a previously exported `.json` configurations file. Once selected, the system will instantly import and populate all the language environments, saving you from setting them up manually.

Help Menu:

- **Help:** Clicking this opens the comprehensive User Manual (this document) in your system's default viewer, providing immediate guidance on how to use the Integrated Assignment Environment.
